INTRODUCTION

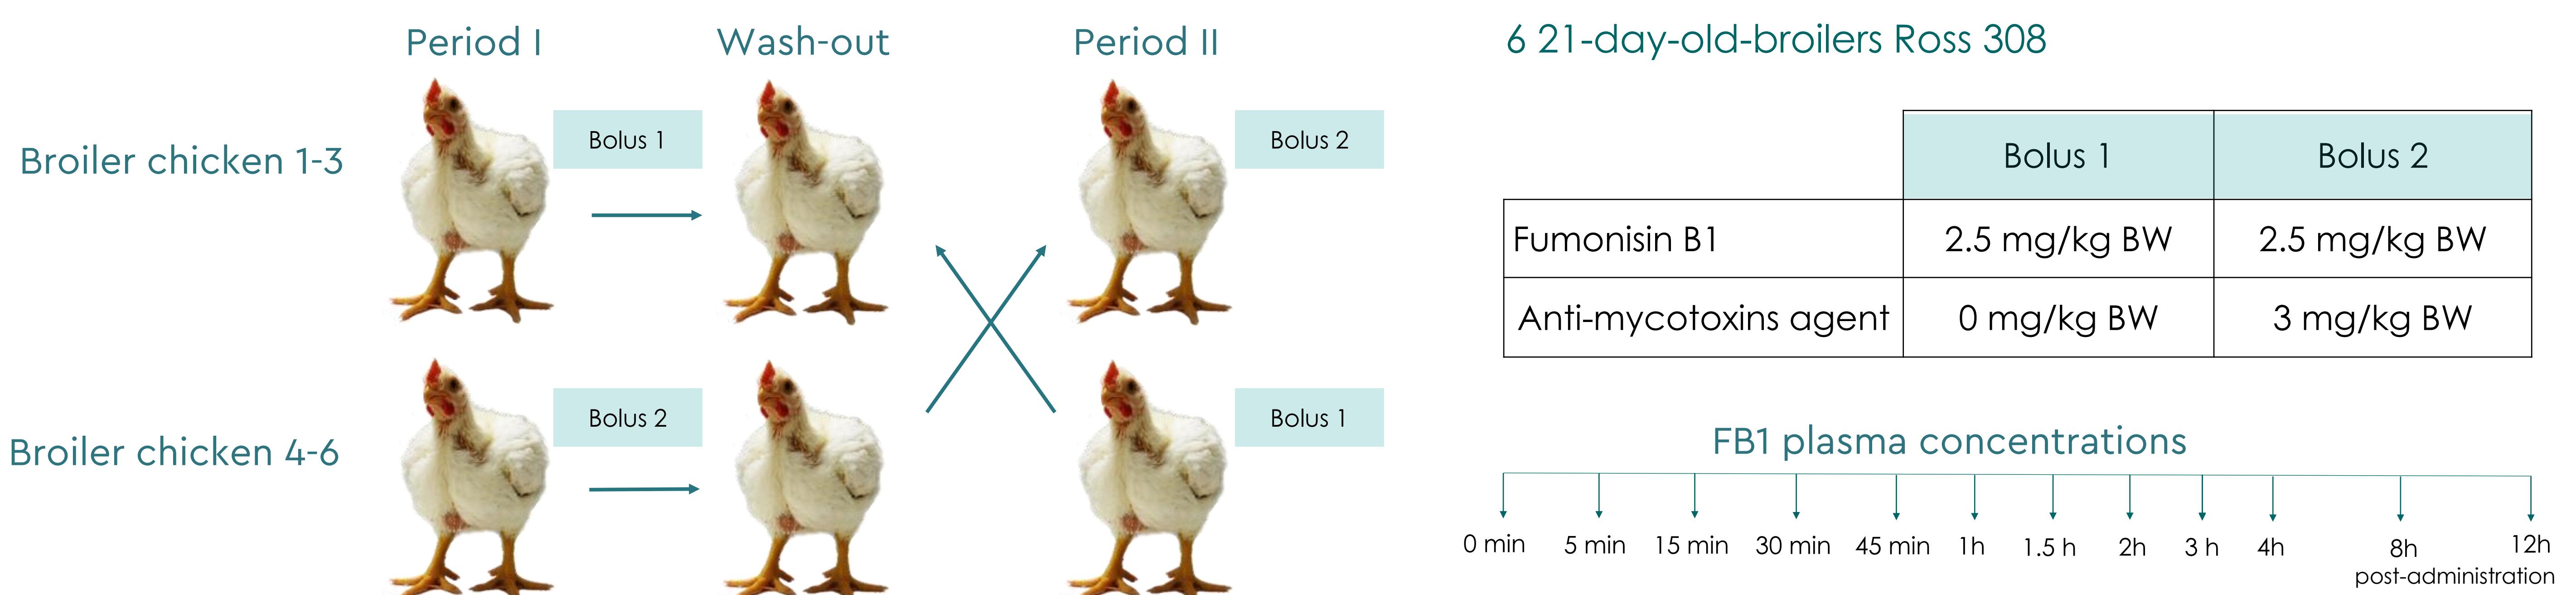

Toxicokinetic studies are necessary to evaluate the efficacy of mycotoxin detoxifiers, considering the possible effects on the oral absorption and disposition of the mycotoxins in broiler chickens. The detoxification capacity of mycotoxins binder for fumonisin B1 (FB1) is rather limited.

OBJECTIVE

The aim of the present study was to determine the effects of an anti-mycotoxins agent based on minerals, phylogenics and organic components on the plasma concentration-time profile of FB1 in broiler chickens.

MATERIALS AND METHODS

Cross-over design

Calculation of the exposure of the broilers to the fumonisin B1:

Area under the curve from time 0 to 12 h (AUC_{0→12})

Maximum plasma concentration (C_{max})

Time at maximal plasma concentration (T_{max})

Elimination half-time (T_{1/2el})

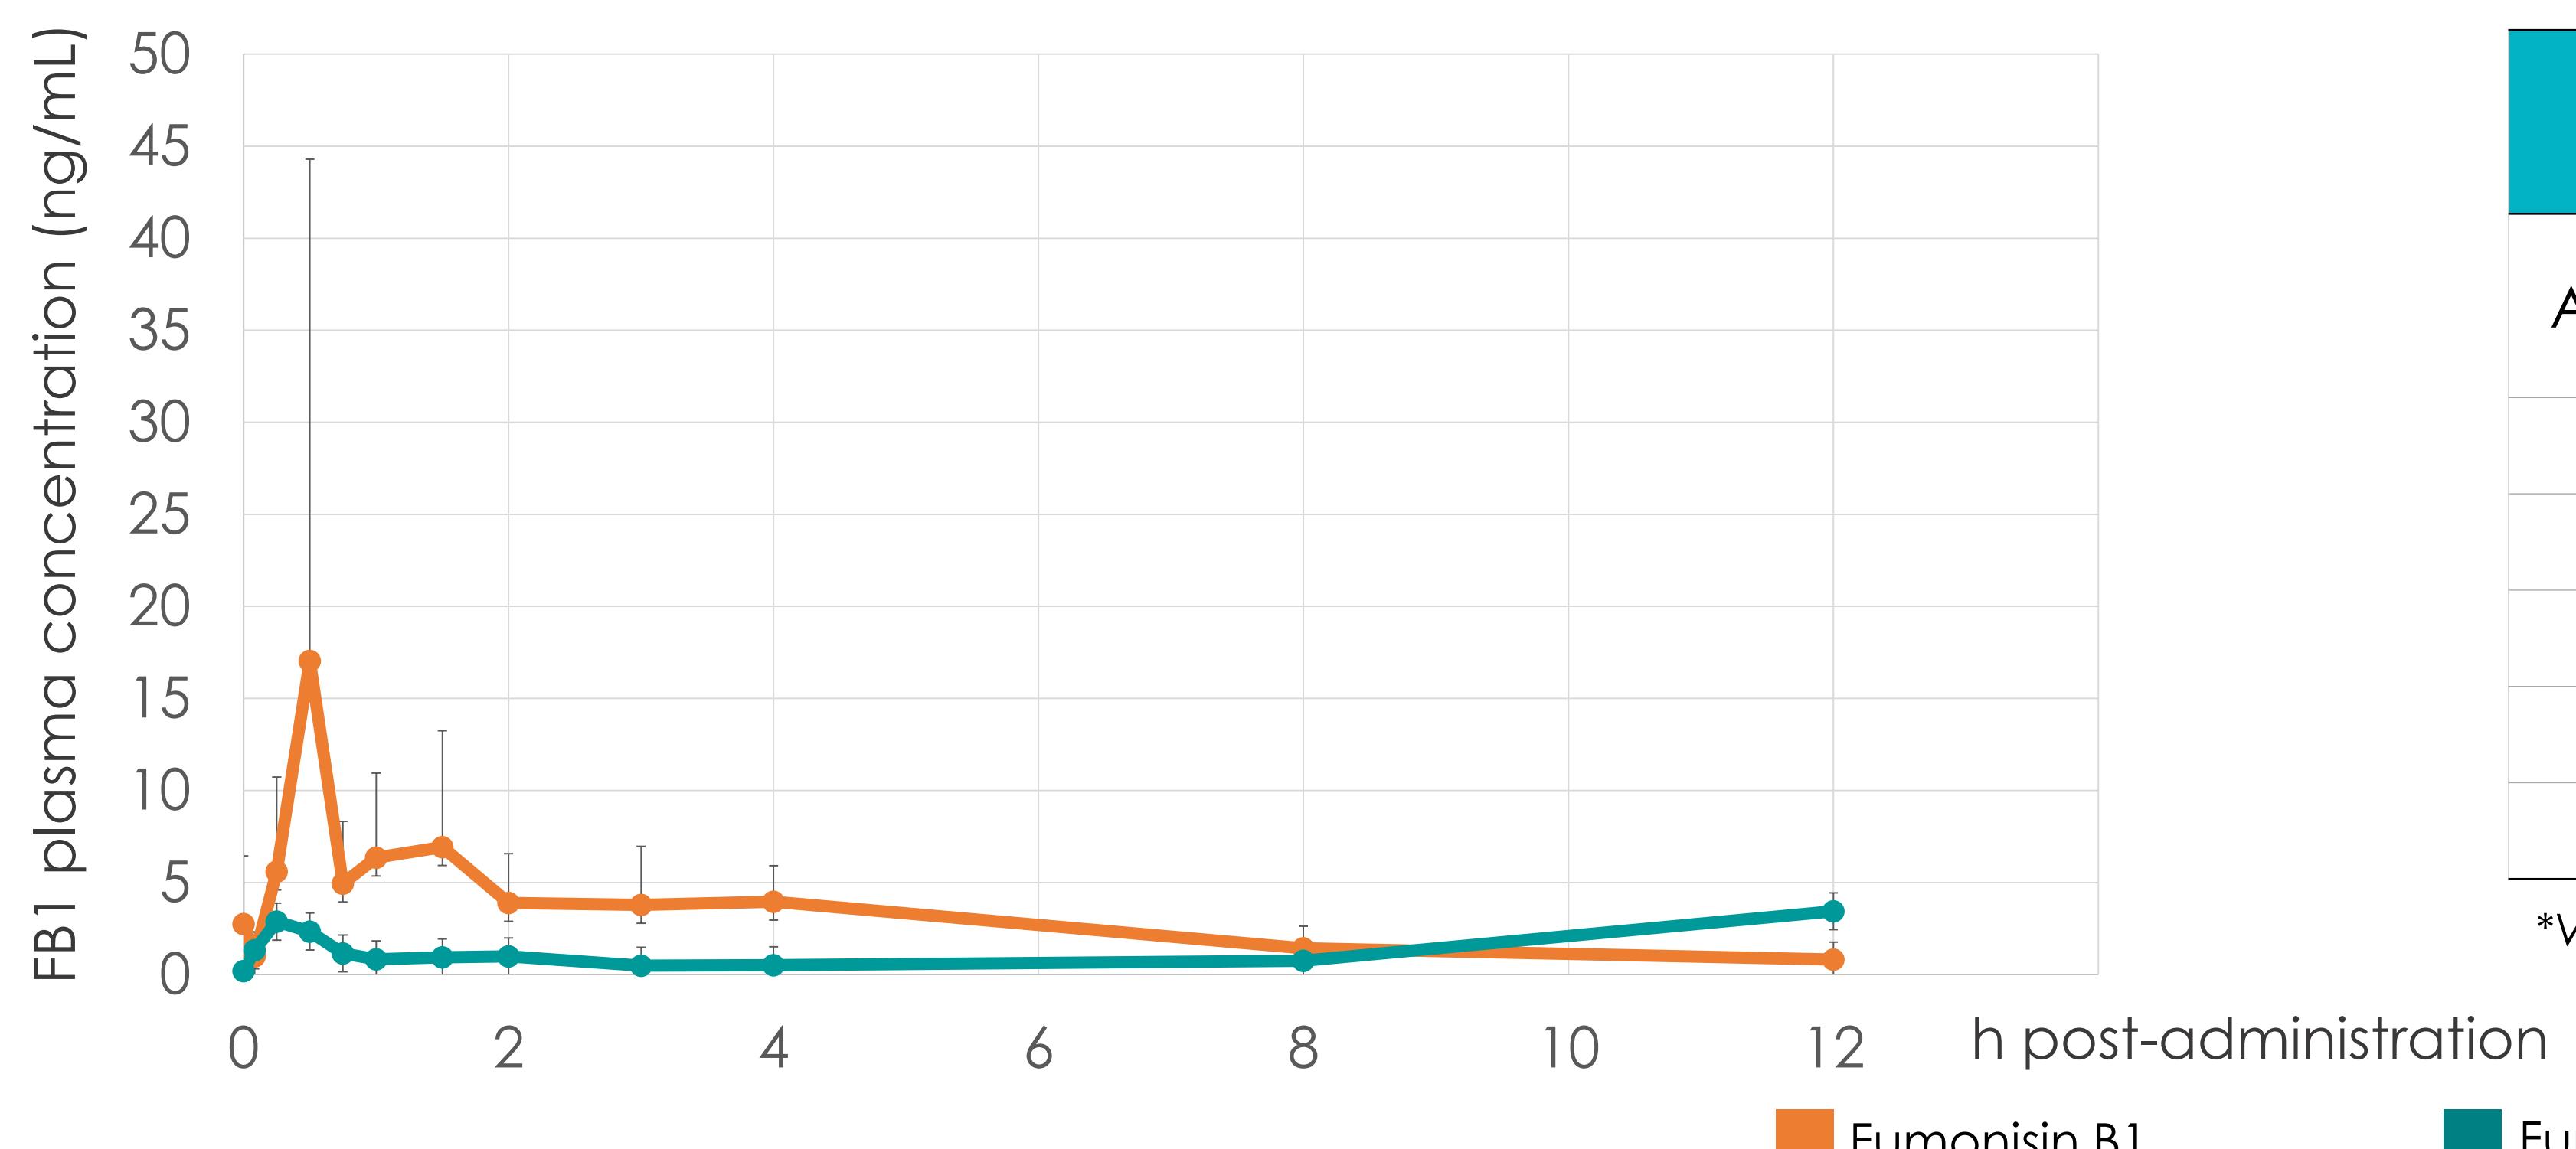

Elimination rate constant (k_e)

Relative oral bioavailability

((AUC_{0→12} fumonisin B1 + anti-mycotoxin agent / AUC_{0→12} fumonisin B1)*100)

RESULTS

Plasma concentration-time profile

Toxicokinetic parameters

| Mean ± SD | Fumonisin B1 | Fumonisin B1 + anti-mycotoxins agent |
|-------------------------------|----------------|--------------------------------------|
| AUC _{0→12} (h.ng/ml) | 34.30 ± 22.760 | 6.167 ± 4.881 |
| C _{max} (ng/ml) | 19.63 ± 26.103 | 5.09 ± 2.937 |
| T _{max} (h) | 1.29 ± 1.40 | 2.63 ± 4.64 |
| T _{1/2el} (h) | 5.82 ± 6.75 | 3.67 ± 2.59 |
| k _e (1/h) | 0.30 ± 0.22 | 0.43 ± 0.50 |
| Relative F (%) | / | 17.98 |

*Values in bold indicate a statistically significant difference ($p < 0.05$).

Fumonisin B1 + anti-mycotoxins agent

CONCLUSIONS

The anti-mycotoxins agent containing minerals, phylogenics and organic components reduced the oral absorption of fumonisin B1, being efficient in reducing the total systemic exposure to fumonisin B1 in broiler chickens.
